This is basically the finest publication i actually have go through till now. We have read and i also am confident that i am going to likely to read through again once more in the foreseeable future. It is extremely difficult to leave it before concluding, once you begin to read the book.

(S) = $y + 3yz + 3yz + yz$, $D(yz) = yz + 4yz + Gy z + iy + yz$. Examining these results, we see that the coefficients of the terms in the successive derivatives are the same as in the corresponding powers of a binomial, and that the accents follow the same and the method of the last section holds, no matter what the value of a. 141. It was shown in Art. 35, that the form 22 could always be reduced to-and treated as above. Let us consider a general example. Suppose $fa = \infty$ and $Fa = \infty$, fx required the true value of J --when $x = a$. $H Fx J fx Fx 0$, J ---when $x = a$. $Fx i 0 fa$ Differentiate numerator and denominator. $fx (fx)^2$ Hence we have, when $x = a$, --. $F x fx (Fx)^2 (fx Fx Fx 1 fx W?x 1=fx F x Fx fx$ and $\# = Fx F x$ the value required. Therefore the form 2J can be treated directly by the same method as the form. In dividing both members 142. The forms ∞ , 1, 0, can all be reduced to one of the forms already discussed, if we make use of logarithms. It is to be observed, that these forms to be indeterminate must all occur as limiting forms of a function of...
