Rarebooksclub.com, United States, 2012. Paperback. Book Condition: New. 246 x 189 mm. Language: English . Brand New Book ***** Print on Demand *****.This historic book may have numerous typos and missing text. Purchasers can download a free scanned copy of the original book (without typos) from the publisher. Not indexed. Not illustrated. 1912 Excerpt: . B is the average of tests number 112, 113, 114,115,116 and 117. - 1) is the average of tests number 121,122 and 123. Table 18--Effect of feldspar in sand-lime brick mixtures. (By S. V. Peppel) Data: Steam pressure--150 pounds per square inch. Temperature in hardening cylinder--185 C. Time exposed to steam--10 hours. Molding pressure--15,000 pounds per square inch. The effect of replacing sand with feldspar to the extent of 10 per cent is not to diminish the strength of the brick. Although there is a slight decrease in its crushing strength there, is an increase in its tensile strength. It has been generally supposed that lime and feldspar would not react when mixed and steamed after the manner of hardening sandlime bricks, but some recent work in the chemical laboratory of the University of Illinois appears to give evidence to the contrary; but whether these two substances react or not is of very little consequence to the sand-lime brick industry, as feldspar is seldom found in sand in sufficient quantities to be detrimental. Eaw clay, when mixed with lime and steamed, will not react with it as quartz does. If, however, the clay be calcined to 500C. and pulverized and then mixed with slaked lime, the two will unite forming a sort of cement. This fact is made use of in the manufacture of lowgrade cements from calcined clay and lime. If the calcination of the clay be carried to 900, instead of 500, the...
